

Physics 12 Unit 4 – Momentum Worksheet #1

1-D Problems including Gov Problems

KEY

Solutions

Name: _____

Date: _____

1. Find the momentum of a 1300 kg car travelling at 55 km/hr.

$$L \div 3.6 = 15.27$$

$$p = mv = 1300 \cdot 15.27 \\ = 19,860 \text{ N}\cdot\text{s}$$

2. A 0.3 kg ball is travelling north at 12 m/s and is then struck by a bat, afterwards the ball is travelling at 21 m/s south.

a) Find the change in velocity (magnitude only)

lets call North (+)

$$V_i = 12 \quad V_f = -21$$

$$\Delta V = V_f - V_i$$

$$= -21 - 12$$

$$\Delta V = -33 \text{ m/s}$$

⊖ just indicates south.

b) Find the change in momentum. Also described as the impulse imparted on the ball.

$$\Delta p = m \Delta v = (0.3)(-33) = 9.9 \text{ N}\cdot\text{s}$$

c) If the collision lasts 0.21 second, what is the average force exerted on the ball during the collision.

$$\Delta p = Ft = m \Delta v \rightarrow \text{solve for } F$$

$$F = \frac{m \Delta v}{t} = \frac{(0.3)(-33)}{.21}$$

$$F = \frac{9.9}{.21} = 47.1 \text{ N}$$

3. A 3 kg hammer strikes a nail at a velocity of 8.5 m/s and comes to rest in a time interval of 8 ms (0.008 sec). What is the average force acting on the nail.

$$F = \frac{m \Delta v}{\Delta t} = \frac{(3)(8.5)}{.008}$$

$$\begin{aligned} \Delta v &= v_f - v_i \\ &= 0 - 8.5 \\ &= -8.5 \end{aligned}$$

$$F = 3188 \text{ N}$$

4. A 1400 kg car travelling at 130 km/hr hits a parked 1800 kg truck. Assuming the two vehicles become entangled, find the velocity of the wreck.

$v = 36.111 \text{ m/s}$

$$P_i = P_f$$

CAR TRUCK WRECK.

$$m v + M V = m v$$

$$(1400)(36.111) + (1800)(0) = 3200 v \text{ ?}$$

$$\begin{aligned} v &= 15.799 \\ &= 15.8 \text{ m/s} \end{aligned}$$

5. A 1400 kg car travelling at 130 km/hr hits a 1800 kg truck travelling the same direction at 90 km/hr. Assuming the two vehicles become entangled, find the velocity of the wreck.

25 m/s

$$P_i = P_f$$

note:
both same direction.
so

$$m v + m v = m v$$

$$(1400)(36.111) + (1800)(25) = 3200 v \text{ ?}$$

$$v = 29.861 \text{ m/s}$$

$$v = 29.9 \text{ m/s}$$

6. A 1400 kg car travelling at 130 km/hr hits a 1800 kg truck travelling the same direction at 90 km/hr. After the collision the truck is travelling at 105 km/hr in the original direction, find the velocity of the car.

$$P_i = P_f$$

$$m_{CAR} v + m_{TRUCK} v = m_{CAR} v + m_{TRUCK} v$$

$$(1400)(36.11) + (1800)(25) = (1400)v + (1800)(29.16)$$

$$v_{CAR} = 30.753$$

$$= 30.8 \text{ m/s}$$

7. A 12,600 kg railroad car travels alone on a level frictionless track with a constant speed of 18 m/s. A 5350 kg load, initially at rest, is dropped onto the car. What will be the car's new speed?

$$P_i = P_f$$

$$m v = m v$$

$$(12,600)(18) = (17,950)v$$

$$v = 12.64$$

$$v = 12.6 \text{ m/s}$$

8. Calculate the force exerted on a rocket given that the propelling gases are expelled at a rate of 1500 kg/sec with a speed of 40,000 m/s.

$$\Delta p = F \Delta t = m v$$

$$?$$

load @ one second

$$F = \frac{m v}{t} = \frac{(1500) \cdot (40,000)}{1 \text{ sec}} = 60,000,000 \text{ N}$$

$$6 \times 10^7 \text{ N}$$

call west (+)

9. Use conservation of momentum.

A 5.0 kg ice block is sliding along a smooth floor at 1.0 m/s west when a 0.20 N force directed east acts on it for 4.0 s. What is the magnitude of the block's final momentum?

- A. 0.80 kg m/s
- B. 4.2 kg m/s
- C. 5.0 kg m/s
- D. 5.8 kg m/s

$$\Delta p = P_f - P_i$$

$$(F)(t) = P_f - mv_i$$

$$(-.2)(4) = P_f - (5)(1)$$

$$-.8 = P_f - 5$$

$$4.2 = P_f$$

10. Change of rate means per unit time, (change in p)/time

The force F shown below is pulling the mass m over a frictionless surface with an acceleration of a .

$$\frac{\Delta p}{\Delta t} = \frac{m \Delta v}{t}$$

$$= m \cdot \frac{\Delta v}{t}$$

$$= m \cdot a$$

Which of the following is equal to the mass's rate of change of momentum?

- A. F
- B. $\frac{F}{a}$
- C. $\frac{F}{m}$
- D. $F \cdot a$

11. What property of the graph represents $\Delta p = Ft$

need FL_+ graph so (A)

The area under which graph best represents the impulse delivered by a tennis racket to a ball?

only choice that makes sense.

12. Look at change in momentum for each cart.

A 2.0 kg ^{CART 1} cart travelling east at 4.0 m/s strikes a stationary 8.0 kg ^{CART 2} cart. After the collision, the 2.0 kg cart bounces back towards the west at 2.0 m/s, while the 8.0 kg cart travels east at 1.5 m/s. Which of the following is the change in momentum for each cart?

	2.0 kg CART Δp (kg · m/s)	8.0 kg CART Δp (kg · m/s)
A.	4.0 East	12 West
B.	4.0 West	12 East
C.	12 East	12 West
D.	12 West	12 East

lets call east (+)

CART 1 $\Delta p = p_f - p_i = mv_f - mv_i = (2)(-2) - (2)(4) = -4 - 8 = -12$ (west)

CART 2 $\Delta p = p_f - p_i = mv_f - mv_i = (8)(1.5) - (8)(0) = 12$ (east)

13. Draw this problem out to clarify the physical situation.

A 7.3×10^3 kg space vehicle and its empty 6.8×10^2 kg booster unit are moving together through space at 370 m/s. An explosion lasting 2.2 s is used to separate the two parts. If the speed of the space vehicle after the separation is increased to 430 m/s, what impulse acted on the booster unit?

- A. 4.1×10^4 N·s
- B. 2.0×10^5 N·s
- C. 2.2×10^5 N·s
- D. 4.4×10^5 N·s

$$p_i = p_f$$

$$m v = m v + m v$$

$$\underbrace{\left(7.3 \times 10^3\right)}_{+ 6.8 \times 10^2} (370) = \left(7.3 \times 10^3\right) (430) + \left(6.8 \times 10^2\right) (v) \quad ?$$

$$(7300 + 680)(370) = (7.3 \times 10^3)(430) + (680)(v)$$

$$V_f = -274 \text{ m/s}$$

of booster

$$\Delta p_{\text{Booster}} = m v_f - m v_i = (680)(-274) - (680)(370)$$

$$= 437,900 \text{ N}\cdot\text{s}$$

OR

$$\Delta p_{\text{Booster}} = \Delta p_{\text{space vehicle}} = m v_f - m v_i$$

$$= (7300)(430) - (7300)(370)$$

$$\Delta p_{\text{Booster}} = 438,000 \text{ N}\cdot\text{s}$$

Same answer either way
